EXPERIENCE

Software Engineer | Azure Backup, Microsoft

May 2022 – Present

C#, .NET, Python, Azure Cloud, Azure DevOps, PowerShell, ARM, Kusto

Hyderabad, India

- Building critical backend services for Azure Backup, a distributed microservices-based system which enables 4,000+ backup and recovery jobs every minute and drives \$1B+ in annual revenue.
- Architected and built a new **inter-stamp mechanism** in Azure Backup for secure, scalable cross-region API calls, replacing the legacy API-version-based pattern, as the sole IC across design and rollout. API built on this mechanism serves **150K+ calls/week** without any incidents.
- Designed and shipped data-plane and customer-facing APIs for two security-critical features — **Backup Vault Soft Delete**, securing customer data against ransomware-driven backup deletion for **1,400+ subscriptions** with **zero incidents in 6+ months** of public preview, and **Cross-Tenant Restore**, enabling secure cross-tenant data recovery for multi-tenant enterprises (private preview).
- Owned the Azure Backup CLI surface: shipped **25+ customer-facing features**, led a major rearchitecting effort, lifting the test coverage from **40% to 100%**, substantially reducing test flakiness, and cutting test suite runtime **by 80% from 2 hours to 25 minutes**. Mentored a Software Engineering intern through CLI feature delivery and onboarded multiple engineers onto self-service CLI workflows, setting the quality bar as final reviewer.
- Drove **throttling for customer-facing frontdoors**. Designed per-endpoint rate-limit policies sized as a multiple of measured peak traffic, rolled out across all production rings, onboarding **25 APIs serving 400K+ requests per hour** onto Azure Throttling Serviceto guard against DDoS attacks and general DoS abuse.
- Served as on-call IC and product SME: resolved **70+ CSS-escalated bugs**, mitigated **30+ customer escalations**, addressed **60+ repair and platform items** targeting security and operability concerns, and shipped operability automation that **auto-mitigates 20+ incidents every month**.

Software Engineering Intern | Azure Backup, Microsoft

May 2021 – July 2021

C#, .NET, Redis Cache, Kusto

Hyderabad (Remote), India

- Reduced latency by up to 37%** across multiple LIST and GET REST APIs by implementing a distributed caching mechanism using Redis.

PUBLICATIONS

Leveraging Multilingual Transformers for Hate Speech Detection

December 2020

- A multilingual Transformer-based NLP system to **identify hateful tweets in English, German, and Hindi**, and further classify them into Hate, Offensive, and Profane categories.
- Generated context-aware embeddings for the cleaned tweet text, segmented hashtags, and emojis, using a transformer architecture, which were fed into a 2-layer MLP classification head. Ran a feature-selection study and achieved a **Macro-F1 of 90.29%** on the binary classification task for English.
- Published at the HASOC 2020 shared task** (Hate Speech and Offensive Content Identification in Indo-European Languages) [\[Link\]](#).

TECHNICAL SKILLS

Languages: C#, Python, PowerShell, Bash, Java, HTML/CSS.

Frameworks and Tools: .NET, Service Fabric, Kubernetes, Docker, Azure Storage Tables, Kusto, TypeSpec, Node.js, Azure DevOps, Git, GitHub.

Concepts: Distributed Systems, Microservice Architecture, REST API Design, Cloud Computing, High-Level Design, Databases, CI/CD.

EDUCATION

International Institute of Information Technology (IIIT), Hyderabad

July 2023

Bachelor of Technology in Computer Science

CGPA: 8.31/10

- Student Web Administrator:** Maintained and upgraded Institute-managed websites and wikis.
- Research Assistant:** Worked on Language Embeddings and Approximate Nearest-Neighbour Vector Search at the Machine Translation and Natural Language Processing (MT-NLP) Lab under Prof. Manish Shrivastava.
- Relevant Coursework:** Data Structures and Algorithms, Operating Systems, Networks, Natural Language Processing, Statistical Methods in AI, Principles of Information Security, Software Engineering.
